Text Encoding Fundamentals: Element list

Elements for basic TEI documents

This is more of a brief reference sheet than an exhaustive list of TEI elements: it is intended to provide you with a way to look up the most commonly used elements, grouped together for the exercises in which we'll be encountering them. For detailed information about the contents and semantics of these elements (and for other more arcane elements), have a look at the TEI Guidelines [http://www.tei-c.org/release/doc/tei-p5-doc/en/html/].

Element groups

structure
   <TEI>, <back>, <body>, <front>, <group>, <teiHeader>, and <text>

general purpose block-level
   <ab>, <argument>, <div>, <head>, <item>, <label>, <list>, <p>, <quote>, and <said>

general purpose phrase-level
   <bibl>, <date>, <distinct>, <emph>, <foreign>, <hi>, <mentioned>, <name>, <q>, <quote>, <rs>, <said>, <seg>, <soCalled>, and <term>

poetry
   <l>, <lg>, and <rhyme>

drama
   <castGroup>, <castItem>, <castList>, <role>, <roleDesc>, <sp>, <speaker>, and <stage>

diary entries, letters, etc.
   <closer>, <dateline>, <opener>, <postscript>, <salute>, <signed>, and <trailer>

alternative transcriptions
   <abbr>, <choice>, <corr>, <expan>, <orig>, <reg>, and <sic>

manuscripts and physicality of documents
   <add>, <addSpan>, <cb>, <del>, <delSpan>, <handShift>, <lb>, <milestone>, and <pb>

editorial annotation
   <app>, <damage>, <gap>, <lem>, <rdg>, <restore>, <subj>, <supplied>, and <unclear>

hypertextual
   <anchor>, <note>, <ptr>, and <ref>
Elements (in alphabetical order)

<TEI>
The outermost (or ‘root’) element for any TEI P5 conformant document. It groups together the TEI header and the document text. It must have the TEI namespace specified, and should have an xml:lang= attribute, i.e. <TEI xmlns="http://www.tei-c.org/ns/1.0" xml:lang="en">.

<ab>
An ‘anonymous block’, that is, a paragraph-like chunk that does not carry the semantic weight of a paragraph. Use type= and maybe subtype= to categorize.

<abbr>
An abbreviation; may be used alone or, when inside <choice>, in combination with <expan> which holds an expanded reading.

<add>
A handwritten addition. The hand= attribute indicates the handwriting in which the addition is made. This attribute contains an identifier which points to a <hand> element in the profileDesc of the TEI header; this <hand> element contains an extended description of the handwriting, ink, and other details.

<addSpan>
An empty element which marks the starting point for a handwritten addition that either is too long to be encoded with <add>, or overlaps an element boundary. Its spanTo= attribute points to an <anchor> element which marks the endpoint of the added material. The hand= attribute indicates the handwriting in which the addition is made (see above for details).

<anchor>
An anchor point, usually used as a place for some other element (such as a note) to point to, using the anchor’s xml:id= attribute.

<app>
Contains one entry in a critical apparatus, with an optional lemma and at least one reading.

<argument>
A short summary or description of the contents of the following section. Contains one or more<p> or <lg> elements.

<back>
Contains the back matter of the document, if any: indices, appendices, epilogues, colophons, errata lists, etc. May be subdivided into <div> elements if necessary.

<bibl>
Used to encode bibliographical references, either in a list (using <listBibl>) or in running prose.

<body>
Contains the main body of the document, not including front matter and back matter. The <body> element typically includes one or more <div> elements. It may start with a <head>. (Think about where the <head> belongs—is it the heading for the body, or the heading for the first division?)

<castGroup>
A grouping of related items in a cast list, containing one or more <castItem> elements and an optional <head> and <trailer>. 
<castItem>
   An item in a cast list, containing a <role> and an optional <roleDesc>.
</castItem>

<castList>
   A cast list in a dramatic text, listing the roles in the drama. It consists of one or more <castItem> or <castGroup> elements.
</castList>

<cb>
   An empty element which marks the break between one column and the next. Equivalent to <milestone unit="column" >.
</cb>

<choice>
   Groups together two or more alternate encodings of a phrase-level passage, using the elements listed below.
</choice>

<closer>
   Very similar to <opener>, but located at the end of the <div> instead of at the beginning
</closer>

<corr>
   A corrected reading of a typographical error or oddity in the original; may be used alone or, when inside <choice>, in combination with <sic>, which holds the original reading.
</corr>

<damage>
   A damaged portion of the original text; the type= attribute allows you to classify the damage, and the extent= attribute allows you to indicate the extent of the damage.
</damage>

<date>
   Used to encode dates. The when= attribute can be used to encode a regularized form of the date (e.g. <date when="2001">The first year of the new century</date> or <date when="2005-05-29">Sun, 29 May 05</date>).
</date>

<dateline>
   Used within <opener> and <closer> to encode the date and place of writing. Contains words and phrase-level encoding.
</dateline>

<del>
   A deletion. The hand= attribute indicates the handwriting in which the addition is made (see above for details).
</del>

<delSpan>
   An empty element which marks the starting point for a deletion that is either too long to be encoded with <del> or that overlaps an element boundary. Its spanTo= attribute points to an <anchor> element which marks the endpoint of the deleted material. The hand= attribute indicates the handwriting in which the deletion is made (see above for details).
</delSpan>

<distinct>
   Used for linguistically distinct words (e.g. dialect words, regionally accented words).
</distinct>

<div>
   A division of a text: for instance, an act, a chapter, a section, a poem, a letter.. Use the type= attribute to indicate what kind of division.
</div>

<emph>
   Used to encode emphasized words or phrases.
</emph>

<expan>
   The expanded reading of an abbreviation; typically used inside <choice>, in combination with <abbr> which holds the corresponding abbreviated reading. Rarely used alone.
</expan>
<foreign>
    Used for foreign-language words when no other element (e.g. <quote>) is already present.
</foreign>

<front>
    Contains the front matter of the document, if any: title pages, tables of contents, introductory essays, and so forth. The <front> element contains an optional <titlePage> and may be subdivided into <div> elements.
</front>

<gap>
    A gap in the original text (either from damage, deletion, excerption, or some other cause). The <desc> child element provides a description of what is missing, and the reason= attribute provides the reason for the omission.
</gap>

<group>
    This element is used to represent documents which contain more than one independent text. It appears instead of <body> in the overall TEI document structure, and groups together multiple <text> elements, with an optional <front> and <back>.
</group>

<handShift>
    An empty element which marks the boundary point at which a change of handwriting takes place. Its new= attribute indicates the handwriting that begins at the point being marked. The new= attribute functions just like the hand= attribute, in pointing to a <hand> element in the TEI header, which provides detailed information on the handwriting in question.
</handShift>

<head>
    The heading of a division: contains words and phrase-level encoding. <head> may appear at the start of <div>, but also at the start of <body>, <front>, <back>, <list>, and <lg>.
</head>

<hi>
    Used to encode words or phrases which are highlighted for reasons which the encoder either does not know or chooses not to analyse.
</hi>

=item>
    An item in a list: contains an optional <label> followed by words and phrase-level encoding, or a series of paragraphs.
</item>

<l>
    A single verse line: contains words and phrase-level elements. May have a met= attribute to formally specify the metrical pattern.
</l>

<label>
    The label of an item (e.g. a letter, number, or word indicating its order or other facts about it): contains words and phrase-level encoding. Note that <label> can also be the first element inside a paragraph.
</label>

<lb>
    An empty element which marks a typographical line break. Equivalent to <milestone unit="line">.
</lb>

<lem>
    A lemma; e.g., the reading from the base text.
</lem>

/lg>
    A group of verse lines: contains one or more <l> elements. May have a rhyme= attribute to formally specify the rhyme scheme, e.g.<lg rhyme="ABAB">.
</lg>

</list>
    A list: contains a series of <item> elements.
<mentioned>
  Used for words which are mentioned but not used (for instance, for spelling or definition purposes).
</mentioned>

<milestone>
  An empty element which marks a boundary point in the text according to some standard reference system, such as signatures, scrolls, leaves. Use the unit= attribute to indicate the reference system whose units are being marked at this point.
</milestone>

<name>
  Used to encode all kinds of names, i.e. proper nouns and noun-phrases. If you want to distinguish between different kinds of names, you can use the type= attribute (e.g. <name type="person">). TEI also includes specific elements for different kinds of names (e.g. <persName>) for projects that need more detailed encoding. The <rs> element is a more generic version of <name>, which may be used to encode common nouns and noun phrases.
</name>

<note>
  A note (a footnote, endnote, marginal note, or inline note). Link the note to the point where it's anchored using xml:id and target=. <note> contains most anything, including words and phrase-level encoding, or one or more<p> elements.
</note>

<opener>
  This element may appear at the start of a <div>, <text>, <front>, or <back>, and it groups together the elements that appear at the start of a letter or similar document: the date and place of writing (using <dateLine>), and the salutation to the person being addressed (using <salute>).
</opener>

<orig>
  An unmodernized reading in the original; may be used alone or, when inside <choice>, in combination with <reg>, which holds a regularized reading.
</orig>

<p>
  A prose paragraph: contains words and phrase-level encoding.
</p>

<pb>
  An empty element which marks the break between one page and another. By convention, information stored in the attributes of <pb> refer to the page that follows the break. Equivalent to <milestone unit="page">.
</pb>

<ptr>
  Indicates a reference to some other XML element (either in the current document or some other accessible document) by pointing to it with a URI on the target= attribute. Must not have content. E.g., <ptr target="#art08_sec08"/>
</ptr>

<postscript>
  Used to encode a postscript, e.g. of a letter.
</postscript>

<q>
  Used to encode passages surrounded by quotation marks, when you don't want to bother with a more precise element like <said>. Roughly the same as <hi rend="surrounded-with-quotation-marks">.
</q>

<quote>
  Used to encode quotations from other sources; contains words and phrase-level encoding.
</quote>

<rdg>
  A single reading, e.g. from a particular witness.
<ref>
Indicates a reference to some other XML element (either in the current document or some other accessible document) by pointing to it with a URI on the target attribute. May (and probably should) have content. E.g., <ref target="#art08_sec08">the <soCalled>IP</soCalled> clause</ref>.
</ref>

<reg>
A modernization of a reading in the original; may be used alone or, when inside <choice>, in combination with <orig>, which holds the corresponding unmodernized reading.
</reg>

<restore>
Indicates restoration of text to an earlier state by cancellation of a marking or instruction; in particular, useful to indicate that a deletion was restored, e.g. by the notation “stet”.
</restore>

<rhythm>
May be optionally used to indicate the portion of the metrical line that rhymes, and with its label attribute which part of the rhyme scheme is in play.
</rhythm>

<role>
The name of a role in a cast list.
</role>

<roleDesc>
The description of a role in a cast list.
</roleDesc>

<rs>
Used to encode all kinds of references to people, places, and things; i.e., nouns and noun phrases. If you want to distinguish between different categories of entity being referred to, you can use the type attribute (e.g. <rs type="person">). The <name> element is a more specialized version of <rs>, reserved for proper nouns and noun-phrases.
</rs>

<said>
Passages spoken aloud or thought, e.g. by a character in a novel.
</said>

<seg>
General-purpose phrase-level segment: use type= and maybe subtype= to categorize.
</seg>

<salute>
Used within <opener> and <closer> to encode the salutation to the person being addressed (e.g. “Dear Sir”, or “I remain faithfully yours...”). Contains words and phrase-level encoding.
</salute>

<sic>
A typographical error or oddity in the original; may be used alone or, when inside <choice>, in combination with <corr>, which holds a corrected reading.
</sic>

<signed>
Used within <closer> to encode the signature or name of the person writing. Contains words and phrase-level encoding.
</signed>

<soCalled>
Used to encode (or express) authorial distance; e.g., phrases that were or should be in scare quotes.
</soCalled>

<sp>
A dramatic speech; usually begins with a <speaker> element, followed by a <p> or <lg>.
</sp>

<speaker>
A speaker identification printed in the text.
</speaker>

<stage>
A stage direction. The type= attribute may be used to identify the kind of stage direction; suggested values include:
business
costume
delivery
entrance
exit
location
narrative
novelistic

<subst>
Groups together an <add> and a <del> so that the addition is understood as being a substitution for the deletion.

<supplied>
Indicates that a given word or passage cannot be read in the original and is being supplied (either through editorial judgment or from some other textual source).

<teiHeader>
The wrapper for all of the document’s metadata. The elements that go inside the TEI header are too numerous to list usefully here; see the templates for details.

<term>
Used to encode specialized terminology; often associated with a <gloss>.

<text>
The wrapper element which contains all of the document’s content. The <text> element is most often used for a single work (i.e. a single published document, or a single aesthetic unit such as a play or a work of fiction). Terms like “single work” and “aesthetic unit” need to be defined by the individual project. A <text> element contains an optional <front>, a mandatory <body>, and an optional <back>.

<trailer>
This element is used for things that come at the very end of the document or section, such as “The End”.

<unclear>
Indicates that a given word or passage is unclear, but not entirely illegible (expresses uncertainty rather than absolute lack of information); multiple alternative readings may be grouped in a <choice> element.

Attributes (in alphabetic order)

**met=**
May be used to specify the metrical pattern of a line (or line group).

**n=**
Provides a label or identifier for this particular element, not necessarily unique.

**next= and prev=**
Allow what is logically a single text object (e.g. a quotation) to be encoded as a series of two or more discrete XML elements, as a work-around for overlap problems. These attributes represent the connections between these fragmentary elements, by pointing to a prior or subsequent element in the chain of fragments. They do so by referring to that element’s xml:id=value.
That is, if `next=` is specified on a `<said>` element, then its value should be a hash mark (#) followed by the value of the `xml:id=` of another `<said>` element, the one that is the next part of the spoken passage. For example, 

```xml
<said xml:id="s01" next="#s02">Hey</said>, he said, <said xml:id="s02" prev="#s01">What's up?</said>.
```

`rend=`
May be used to specify how the element looked in the source. E.g., `<head rend="align (center)"` or `<l rend="indent(2)">`.

`rhyme=`
May be used to specify the rhyme scheme of a line group.

`target=`
Provides a URI (e.g. `http://bauman.zapto.org/gallery/Niagara_Falls_2008-01/2008_01_07T16_35_39` or `#sect08`) that points to either another document or an element within an XML document (including the current one).

`xml:id=`
Provides a unique identifier for this particular element, thus allowing other elements to point to it (using their `target=`, `next=`, `prev=`, etc.).

`xml:lang=`
Used to indicate the language of an element’s content. Its value conforms to BCP 47 (a standard system for defining language codes). For information on how BCP 47 codes are constructed, see the note in the data.language documentation. Some sample values for the `xml:lang=` attribute are:

<table>
<thead>
<tr>
<th>Language</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>English</td>
<td>en</td>
</tr>
<tr>
<td>French</td>
<td>fr</td>
</tr>
<tr>
<td>German</td>
<td>de</td>
</tr>
<tr>
<td>Italian</td>
<td>it</td>
</tr>
<tr>
<td>Latin</td>
<td>la</td>
</tr>
<tr>
<td>Arabic as spoken in Iraq</td>
<td>ar-IQ</td>
</tr>
<tr>
<td>Chinese</td>
<td>zh</td>
</tr>
<tr>
<td>simplified Chinese</td>
<td>zh-Hans</td>
</tr>
<tr>
<td>Taiwanese</td>
<td>zh-TW</td>
</tr>
</tbody>
</table>

If further explanation is required, a `<language>` element with an `ident=` attribute of the same BCP 47 code can be specified in the TEI header.
